

# INDIA\_COVID\_INSIGHTS

## 1ST

The total cases increased from 2.6 to 3.28 from April 2020 to May 2020 because the lockdown was not imposed at a full extent and appropriate measures were not known on how to handle covid.

After that there was a significant drop until 2021 when lockdown was being relaxed a bit and 2nd wave was about to hit, which increased the percentage of cases but this was only for a short time.

## 2nd

Total deaths from total cases in India remained around 0.893 from 2020 to 2023 as compared to the world average of 2.2 percent.

## 3RD

Though India had the 3rd highest death count where USA was the first and Brazil was the second. It is inaccurate to judge the covid handling issues of this number as compared to the globe because India has the second highest population in the world. So when we compare the percentage of death from the total population in India and from the globe, India stands in 149th number where total deaths is 0.0375% as compared to the whole world.
